Software Engineer (Front-end focus)

SUMMARY

Senior frontend engineer (7 years, React/TypeScript) working toward full-stack ownership of product decisions — not just implementation. Track record of measurable technical impact (performance, reliability) paired with direct involvement in resolving ambiguous UX requirements alongside PMs.

EXPERIENCE

Globant — Senior Web UI Developer

Remote · Oct 2024 – Present

Disney account

- Resolved an ambiguous product requirement ("assign X to a person") into a role-based flow — individual assignment for non-leads, bulk assignment to self + subordinates for leads — co-designing the logic with the PM via screens/flows, then implementing and testing both the assignment and removal flows.

Minds — 360° audience segmentation platform for football clubs (Spain)

- Migrated manual form implementations to React Hook Form, reducing stale-state bugs by 80%.
- Optimized custom hooks and React Query caching, cutting duplicated API calls by 30%, reducing load times by 1.2s, and eliminating DDoS-like request spikes caused by redundant calls.
- Extended internal UI library with improved keyboard navigation and accessibility support.

Blue Alba — Senior Frontend Developer

Remote · Apr 2021 – Oct 2024

- Introduced TanStack Query and Zustand as the team's default data/state pattern, cutting time-to-interactivity by 30% and resolving recurring data-sync bugs.
- Built unit/integration test coverage (Jest, RTL) targeting custom hooks for long-term reliability.
- Extended the internal component library, removing duplicated code across projects; led an internal workshop to drive team-wide adoption of the new data-fetching pattern.

Despegar — Web UI Developer

Buenos Aires, Argentina · Oct 2018 – Apr 2021

- Migrated legacy Angular.js/JS codebase to React 16 with Hooks and TypeScript.
- Built self-service reservation management features, reducing repeat support calls and improving satisfaction survey results.

FEATURED PROJECT

Open Library — Borrowing Experience Redesign (case study: lilapapazian.dev)

Rebuilt Open Library's borrowing flow from research to prototype: 7-state model derived from real GitHub issues, documented decision log (including corrections, e.g. validating loan-limit logic directly against the borrow.py source), Figma wireframes, and a React/Vite/Tailwind prototype against production design tokens. In usability testing now.

SKILLS: React · TypeScript · React Query · Jest · Figma · Design systems · Requirements translation · Accessibility
